SUMMARY OF QUALIFICATION

Student Computer Science faculty, information systems D3, from UPN "Veteran" Jakarta, with front-end skills in web and mobile app development, using React Native. Great coding and technical skills combine well with exceptional leadership and communication skills gained from being Head Of Public Relations at BEMF-IK and at the FIK FAIR.

EDUCATION

Faculty of Computer, UPN "Veteran" Jakarta
Associate Degree (D3) in Information Systems

August 2024 – Now
Major GPA : 3.94/4.00

ORGANIZATION

Head of Public Relation, BEMF-IK UPN "Veteran" Jakarta

January 2026 - Now

- Lead the PR department to develop strategic communication plans and maintain a positive organizational image.
- Establish external partnerships with other student organizations and external institutions.
- Manage official communications, including handling correspondence and broadcasting public announcements.
- Coordinate preventive workflows to address and resolve communication challenges within the student body.

Head of Public Relation, FIK FAIR 2026

January 2026 - Now

- Direct promotional campaigns and media outreach to maximize the visibility of FIK FAIR 2026.
- Manage the invitation and onboarding process for international webinar delegates, official guests, and committees.
- Collaborate with external partners to secure strategic collaborations and expand event media coverage.

Staff of Public Relation, BEMF-IK UPN "Veteran" Jakarta

January 2025 - January 2026

- Maintain communication networks to bridge relations between the organization and external stakeholders.
- Draft and distribute official broadcast messages, invitations, and announcements to target audiences.
- Support the department head with administrative tasks and the execution of various PR work programs.

RELEVANT EXPERIENCES

Laboratory Assistant, Faculty of Computer

February 2026 - Now

Database System

- Guided approximately 30 students during lab sessions focused on relational database concepts using MySQL.
- Explained basic topics about MySQL and important concepts such as DDL, DML, ERD, normalization, and table relationships.
- Assisting lecturers in creating learning modules used during practical sessions.
- Assessed project-based assignments and practical exams, providing both technical and conceptual feedback.
- Providing assistance during practical exams and ensuring academic integrity during the practical sessions.

PROJECT EXPERIENCES

Halal Tracker App

- Structured Global State Management: Built using React Native with Context API and useReducer implementation to manage activity data efficiently and eliminate rendering loops.

- **Target & Activity Tracking:** Features a tracking system for user daily activities and visitation targets, complete with real-time completion status.
- **Backend-to-Frontend Integration:** Consumed data from backend to frontend using API calls with JSON formatting to display dynamic user and product data lists.
- **Modular Code Architecture:** Designed the application with a modular approach to ensure clean, readable, and highly scalable component structures.

Technologies used : React Native, JavaScript, React Hooks (useState & useEffect), Context API, useReducer, JSON, and RESTful API.

FleetGo

- The system handles users through separate roles for customers admins approvers and drivers. Access stays split so workflows don't overlap much. Booking starts when a customer submits a request and then approvers review it before admins and drivers handle the daily side.
- That part makes sense on paper but feels a bit messy when trying to picture the handoffs.
- Front end work uses Vue.js while the back end runs on Node.js and they pass data through JSON APIs.
- **Token-Based Security & Authentication:** Implements a security system using token-based authentication and protected routes to ensure each role can only access authorized pages and functionality.

Technologies used : Vue.js, JavaScript, HTML, CSS, Node.js.

ConnectSphere

- The app handles login through firebase with email or google options. It uses zustand to keep track of the user globally and routes people away from the main menu until they are signed in. That part feels pretty standard but it works without much hassle.
- Posts can be made with pictures attached and the feed loads more as you scroll using firestore pagination.
- Social stuff includes likes and comments that show up live. There is also a follow feature that lets accounts be public or private. User search runs in the background and there are suggested friends based on some algorithm.
- Messaging is one on one and chats get encrypted on the client side. Features like typing dots, read checks, reactions with emojis, replying by swiping, and sending voice or image notes are all there.
- Privacy controls cover blocking and muting plus a close friends list that limits who sees posts or status updates.
- Notifications come through firebase cloud messaging with links that open specific parts of the app. Offline support is handled by keeping data in firestore and there is a live status that pulls from location or music and only lasts a day.

Technologies used : React Native, Expo , Firebase.

TECHNICAL EXPERIENCES

Programming Language : C, JavaScript, HTML, CSS

Operating System : Windows and Linux

Database : MySQL, Firebase, PostgreSQL

Software : Visual Studio Code, IDEA, Android Studio.

Design Tools : Figma,

Other Tools : GitHub and Google Colab
